

Service Calibration services

Calibration support

FT•NIR instruments use calibrations – mathematical equations – and these calibrations have to be developed and maintained. We offer various services in this area like:

- Calibration development, validation, implementation and maintenance
- Calibration support contract
- Calibration overview
- Calibration update

We support calibration software PLSPlus/IQ from Thermo.

Calibration support contract

Our employees can help customers to look after the calibration models. Customers can sign up for a period of 6-12 months and have their calibrations looked after regarding bias-adjustments and performance. Each month or every second month they will get a status report on the performance of their calibrations – on behalf of data provided by them. Calibrations will be marked as OK or update needed.

Calibration overview

Customers can get a second opinion on the performance of their NIR-equipment. We run through their calibration and validation data sets to verify if there is a possibility to make their calibrations even better and more robust.

Calibration update

If there is a need to update calibrations – but no time and expertise to do so – our customers can contact us for a non-committal offer.
